Introduction to Programming

Streams and Strings

Sergey Shershakov

#3/17 Jan 2019

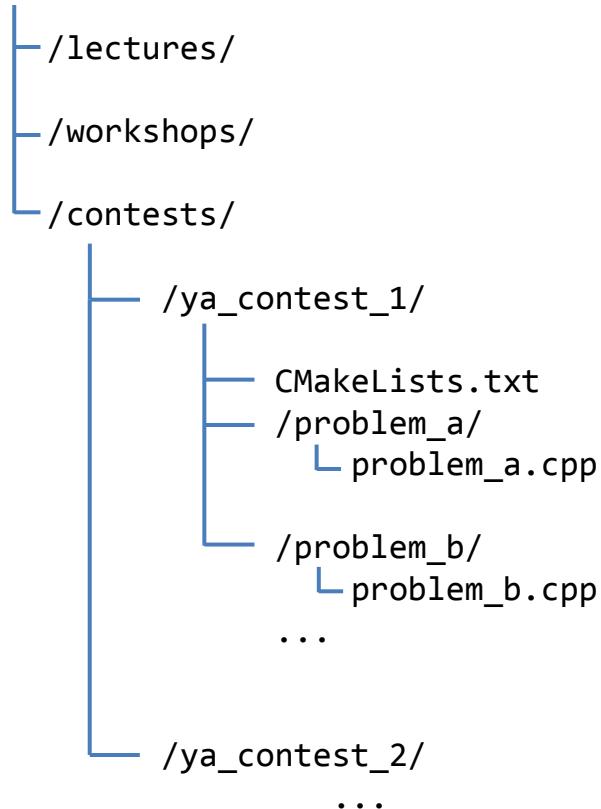

Test 2 (5 pts)

<https://goo.gl/forms/7PqlqR3zSZFgWxMs1>

Recommended Contest Project Structure

~/se/progr/

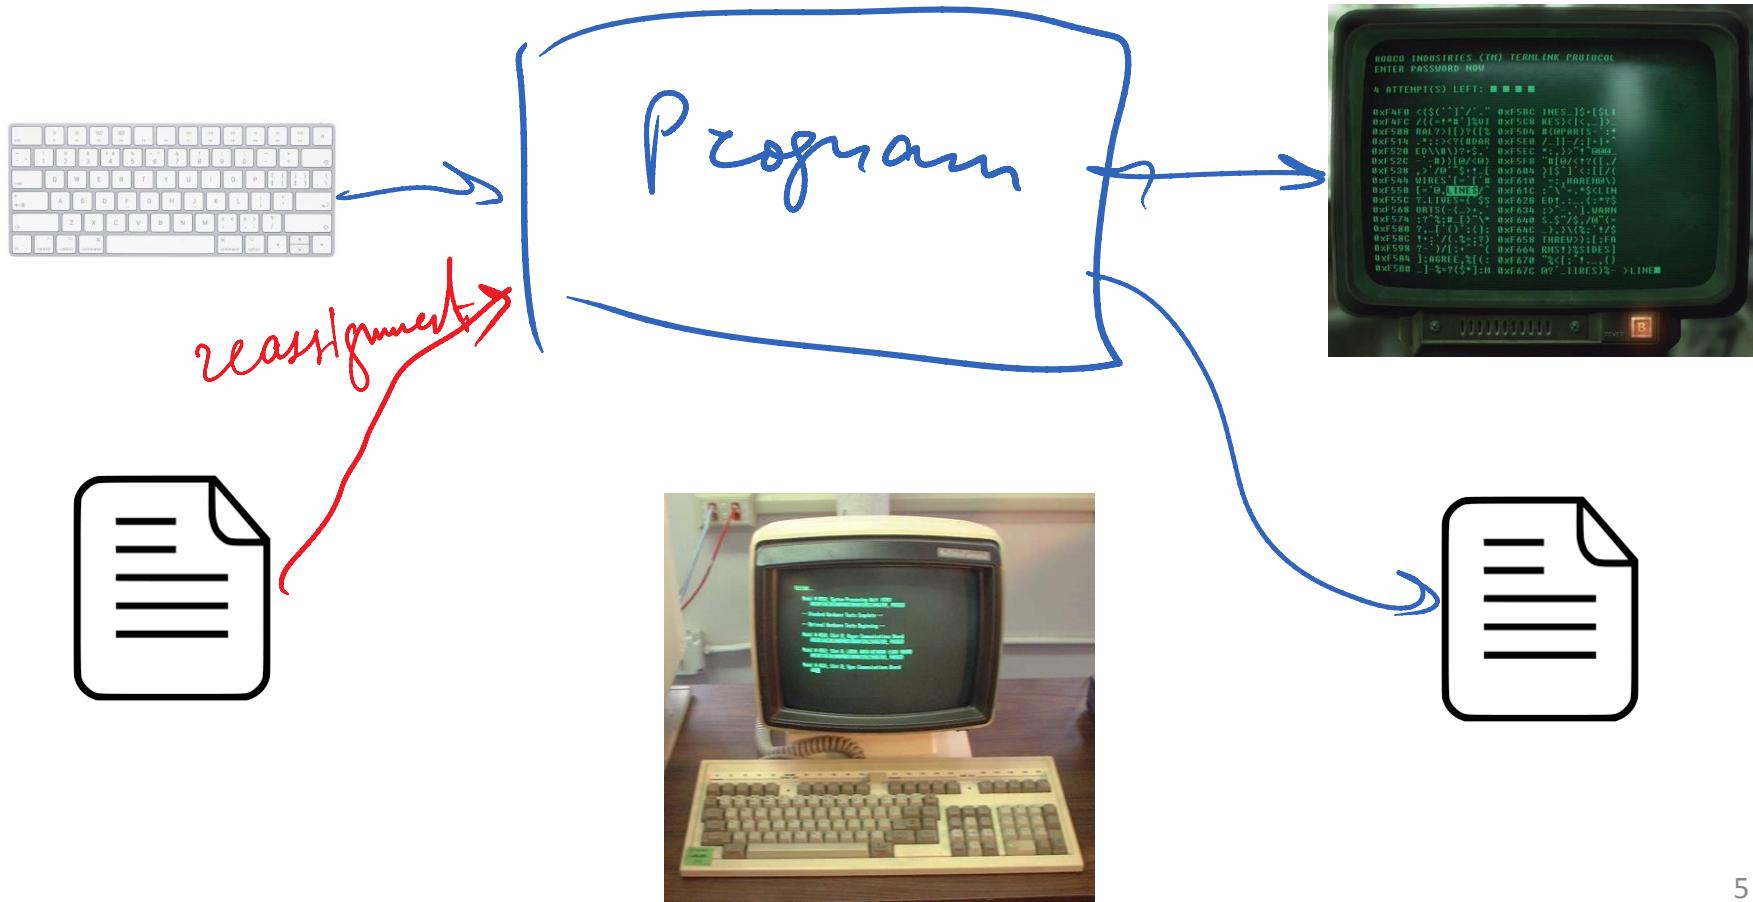

The screenshot shows a Qt-based IDE interface. On the left, the 'Projects' panel displays a project named 'YaContest1' with sub-items: 'CMakeLists.txt', 'ProblemA', 'ProblemB', 'ProblemC', 'ProblemD', 'ProblemE', 'ProblemF', 'ProblemG', 'ProblemH', 'ProblemI', 'ProblemJ', 'ProblemK', 'ProblemL', and 'ProblemM'. The 'ProblemA' item is expanded, showing its contents. On the right, the main window shows the file 'problem_a.cpp' with the following code:

```
/*! \file problem_a.cpp
 * \author Student Name
 * \version 0.1
 * \date 15.01.2019
 *
 * Solution of the Problem A/
 *
 * Task: <paste it here if you want to
 *
 * Input format: <paste it here
 *
 * Output format: <paste it here
 */
int main()
{
    return 0;
}
```

Below the code editor, a status bar provides project information: 'Project: YaContest1', 'Kit: Desktop Qt 5.11.1 MinGW 32bit', 'Build: Debug', and 'Deploy: Deploy Configuration'. A 'Run' section at the bottom lists 'ProblemA', 'ProblemB', and 'ProblemC', with 'ProblemA' currently selected.

INTRODUCTION TO I/O AND STREAMS

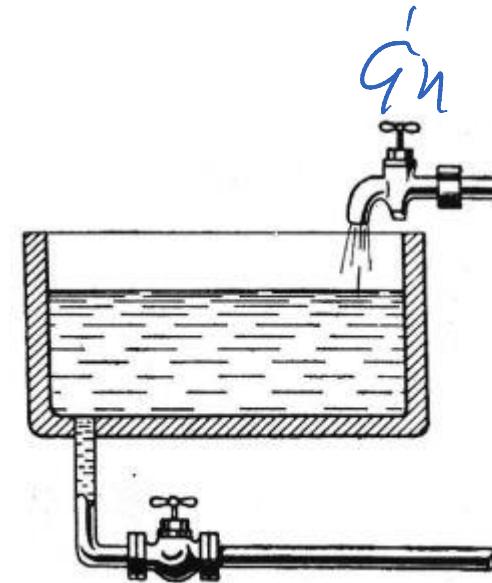

IO Model of a Program

Streams

- A *stream* is an abstraction for input/output.
- Standard input and standard output are represented by global objects `std::cin` (of a type `std::istream`) and `std::cout` (of a type `std::ostream`) respectively.
- One can think of a stream as a source (input) or a destination (output) of characters of an indefinite length.
- Input data to a program from a stream:

```
int x;  
double y;  
std::cin >> x >> y;
```

- Output data from a program to a stream:

```
std::string userName = "Sergey";  
std::cout << "Hello, " << userName;
```

STRINGS AND ENCODING SCHEMES

Representation of Characters

- We have a set of characters we want to use in a computer:

O I Z 25

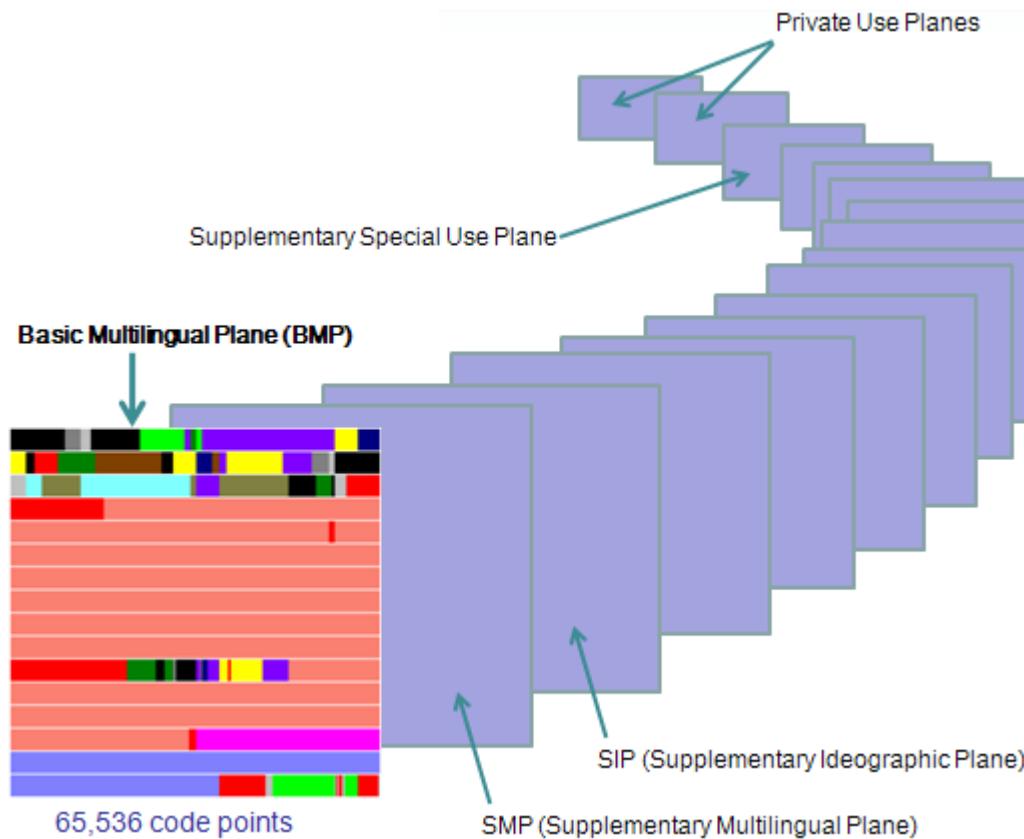

- A, B, C, D, ..., Z
- a, b, c, ... z
- 0, 1, 2, ..., 9
- !, @, #, \$, %, ^, &, *, (,), -, _, =, +, , ; , ...
- let's enumerate them!

- What about national alphabets?

- А, Б, В, ... Я, а, б, в, ... я
- А, В, Г, Δ, Ε, ..., Ω, α, β, γ, ... ξ, ω
- ...

Unicode Standard

- Codes almost all known symbols using quite big numbers (millions)
- Structured by using planes and blocks
- Can be implemented by different character encodings

Basic Multilingual Plane

00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F

- Latin script
- Non-Latin European scripts
- African scripts
- Middle Eastern and Southwest Asian scripts
- South and Central Asian scripts
- Southeast Asian scripts
- East Asian scripts
- CJK characters
- Indonesian and Oceanic scripts
- American scripts
- Notational systems
- Symbols
- Private use
- UTF-16 surrogates
- Unallocated code points

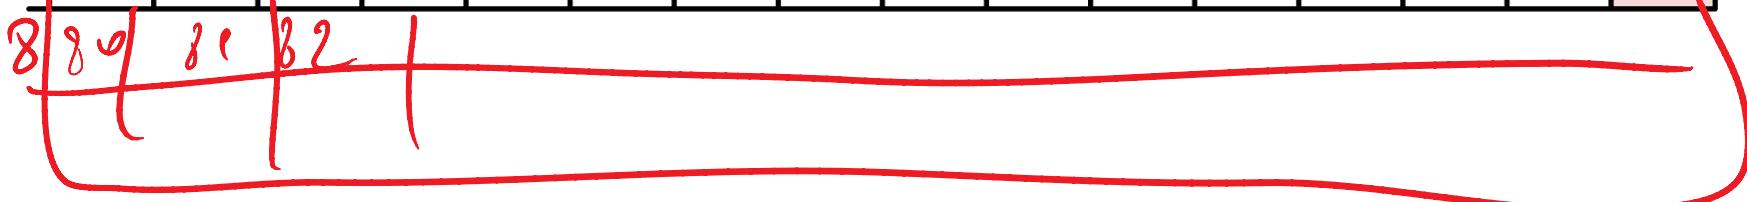

As of Unicode 11.0

8-bit code pages

- Each character is coded by a number from 0..255
- Too small to fit even the most basic characters
- Each alphabet has its own coding standard:
 - ASCII — basic set of 127 characters inc. Latin
 - CP866 — obsolete “DOS” Cyrillic codepage
 - CP1251 (ANSI) — Windows-based Cyrillic codepage
 - KOI8-R — obsolete Linux-based Cyrillic codepage
 - ...

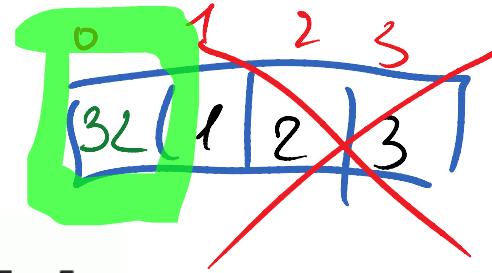

ASCII Table

ASCII Code Chart															
0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

```

Types for Representing Characters

Type	Size	Range	Codepages (examples)
char	8 bit	0..255	Fixed width: ASCII (ext), CP1251, KOI8-r
			Variable width: UTF-8
char16_t	16 bit	0..65535	Fixed width: UCS-2 “Variable width” (surrogate pairs): UTF-16
char32_t	32 bit	0.. 4294967295	UTF-32
wchar_t	16 or 32 bit		UCS-2

- UCS-2 — 2 bytes per symbol, fixed size
- UTF-16 — 2 or 4 bytes (surrogate pairs) per symbol, variable size
- UTF-32 — 4 bytes per symbol, fixed size
- UTF-8 — 1 to 4 bytes per symbol, fixed size

UTF-8

- 1 to 4 bytes per symbol:
 - 1 byte codes ASCII symbols (0..127)
 - 2 bytes code 1 920 symbols including: Latin-script alphabets, and also Greek, Cyrillic, Coptic, Armenian, Hebrew, Arabic, ..., *Combining Diacritical Marks* (é, è, ê, á, á, á, í, ü, ö, ÿ, ...)
 - 3 bytes code the rest of the Basic Multilingual Plane including Chinese, Japanese, Korean
 - 4 bytes for other symbols such as math symbols, emoji etc.

Number of bytes	Bits for code point	First code point	Last code point	Byte 1	Byte 2	Byte 3	Byte 4
1	7	U+0000	U+007F	0xxxxxxxx			
2	11	U+0080	U+07FF	110xxxxx	10xxxxxx		
3	16	U+0800	U+FFFF	1110xxxx	10xxxxxx	10xxxxxx	
4	21	U+10000	U+10FFFF	11110xxx	10xxxxxx	10xxxxxx	10xxxxxx

```

Introducing Arrays

- *Array* (plain C-style) is a set of objects of the same type placed in adjacent memory cells.
- `int nameOfArray[5];`
- `int nameOfArray[5] = {9, 10, 30, 40, 42};`

Array Initialization

- `int x[4] = {3, 6, 8, 10}; // okay`
- `int y[4]; // okay`
- `y[4] = {5, 6, 7, 9}; // not allowed`
- `y = cards; // not allowed`

- `double points[5] = {3.0, 1.2}; // fewer is ok`
- `short stars[] = {1, 5, 3, 8}; // is ok, compiler counts
// the number of elements for you`

- How to find out the number of items?

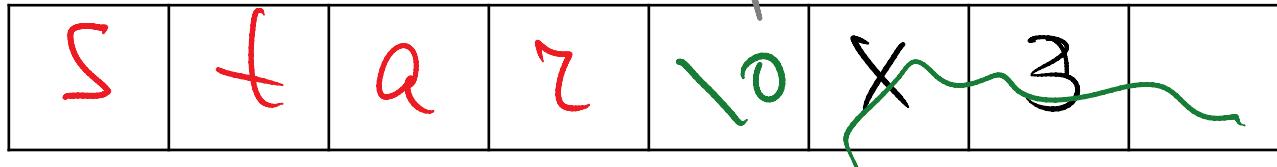

```
short things[] = {1, 7, 2, 10};  
int elNum = sizeof(things) / sizeof(short);
```

$$\frac{4 \times \text{sizeof}(\text{short})}{\text{sizeof}(\text{short})} = 4$$

Is a String an Array of Symbols?

- `char a[8] = {'b', 'e', 'a', 'u', 'x', ' ', 'I', 'I'}; // not a string!`
- `char s[8] = {'f', 'a', 't', 'e', 's', 's', 'a', '\0'}; // a string!`

`char str1[8] = "Star";`

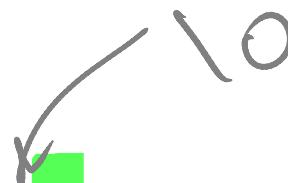

Class std::string

- std::string → std::basic_string<char>

8-6.7

- represents strings with 8-bit characters:
 - fixed-width: *ASCII*, *CP1251*, *CP866*,...
 - variable-width: *UTF-8*

```
std::string s = "I'm a string!";
```

- has an internal buffer to store a continuous sequence of characters
 - `s.c_str()` returns a pointer to the buffer
- has a number of useful methods and operations:
 - `s.size()`, `s.length()` for a string's length;
 - `s.clear()` clears a string;
 - `s.empty()` test if a string is empty;
 - `s[10]` gives an individual (11th) symbol in the sequence;
 - `s + "Abs"` — concatenation, gives a new string.

Reading String Data from a Stream

- Reading strings word by word:

```
std::string s1, s2;  
std::cin >> s1 >> s2; // "Abc Xyz"
```

- Reading a whole line containing spaces (see [Ya.Contest 1 Problems E](#)):

```
std::string bigStr;  
std::getline(cin, bigStr); // "Hello World!"
```

- Reading a text character by character (see [Ya.Contest 1 Problems H](#)):

```
char ch;  
std::cin >> std::noskipws;  
std::cin >> ch;  
std::cin >> ch;  
  
...  
or  
char ch2 = std::cin.get();  
std::cin.get(ch2)
```
